

Abstract of th disclosure

A semiconductor integrated circuit device includes a terminal and a first capacitance adjusting section. The first capacitance adjusting section is
5 connected to a wiring between the terminal and a protection resistor in front stage of an internal circuit. The first capacitance adjusting section adjusts terminal capacitance of the terminal, based on capacitance of the first capacitance adjusting section.
10 The semiconductor integrated circuit device may further include a protection circuit which is connected to the wiring between the terminal and the first capacitance adjusting section and protects the internal circuit.
